GROUP 2700

IN THE CLAIMS

31. (Three times Amended) An apparatus for enhancing the quality of an input audio signal produced from audible sound and having a band of frequencies with a high end and a low end, said apparatus comprising:

a circuit operatively adapted such that when an input audio signal having a band of frequencies with a high end and a low end is transmitted therethrough, the input audio signal is distorted so as to increase in amplitude as per increasing frequencies from a reference frequency up to an amplitude peak at a high frequency
